

What is claimed is:

1. A feed dispenser comprising:
 - a feed reservoir for holding a nourishment;
 - a feeding assembly for conveying the nourishment from the feed reservoir to an animal; and
 - a coupler for unreleasably coupling the feeding assembly to the feed reservoir such that the feed dispenser is rendered non-reusable if the feeding assembly and the feed reservoir are disengaged from a coupled position.
2. The feed dispenser of claim 1, wherein the feeding assembly is adapted to receive a flow of nourishment from the feed reservoir.
3. The feed dispenser of claim 1, wherein the feed reservoir comprises a first end and a second end, and wherein the second end has an orifice through which the nourishment flows to the feeding assembly.
4. The feed dispenser of claim 1, wherein the feed reservoir comprises a first end and a second end, and wherein the second end comprises a neck having an orifice through which the nourishment flows to the feeding assembly.
5. The feed dispenser of claim 3, wherein said feeding assembly comprises a conduit having a first end and a second end, wherein the first end of the conduit is adapted to communicate with said orifice, and the second end is a feeding orifice adapted to provide nourishment to the animal.
6. The feed dispenser of claim 4, wherein said feeding assembly comprises a liquid conduit having a first end and a second end, wherein the first end of the conduit is adapted to mate with the neck and communicate with the orifice of the neck, and the second end of the conduit is a feeding orifice adapted to provide nourishment to the animal.

7. The feed dispenser of claim 1, further comprising a means for suspending the feed dispenser.
8. The feed dispenser of claim 1, further comprising an insect deterrent.
9. The feed dispenser of claim 1, wherein the coupler comprises at least one reservoir flange disposed on the feed reservoir, and at least one feeding assembly flange disposed on the feeding assembly adapted to unreleasably engage with the at least one reservoir flange when the feed reservoir is coupled to the feeding assembly.
10. The feed dispenser of claim of claim 9, wherein the at least one reservoir flange and the at least one feeding assembly flange are oppositely angled so as to permit movement relative to one another in one direction and restrict movement relative to one another in an opposite direction such that the feed reservoir and the feeding assembly interlock with each other.
11. The feeding dispenser of claim 1, wherein the feeding reservoir comprises a guide forming a path and a directional restrictor positioned on the path, and wherein the feeding assembly comprises a follower for tracking the guide and a collocated directional restrictor for engaging with the directional restrictor on the feeding reservoir, and wherein the coupler comprises the cooperative arrangement between the directional restrictor on the feeding reservoir and the collocated directional restrictor on the feeding assembly such that reversible movement between the feed reservoir and the feeding assembly is not possible once the directional restrictors are engaged with one another.
12. The feeding dispenser of claim 11, wherein the directional restrictor on the reservoir comprises a ramped surface connected to a blocking surface, and the collocated directional restrictor comprises a ramped surface connected to a blocking surface, wherein the ramped surfaces contact each other as the feeding reservoir is moved in a clockwise direction relative to the feeding assembly during the assembling of the feed dispenser, and the blocking surfaces contact each other when the feeding reservoir is moved in a counter-clockwise direction relative to the feeding assembly after the assembling is completed.

13 The feed dispenser of claim 9, wherein the feeding assembly comprises a gasket for providing a liquid-tight seal between the feeding assembly and the feed reservoir.

14. The feed dispenser of claim 1, wherein the feed reservoir comprises a brim and the feeding assembly comprises at least one flexible flange adapted to be slideable over the brim into a locking position and forming an unreleasable liquid-tight coupling between the feeding reservoir and the feeding assembly, and wherein the feed assembly comprises at least one conduit for channeling nourishment from the reservoir, through the feeding assembly, and to the animal.

15. A feed dispenser kit, comprising:
a feed reservoir containing a feeding solution, wherein the feed reservoir has an orifice at a first end;
a frangible membrane for covering the orifice; and
a feeding assembly adapted to unreleasably engage the feed reservoir and prevent the re-use of the feed dispenser kit.

16. The feed dispenser kit of claim 15, further comprising a conduit adapted to pierce said frangible membrane when said conduit is inserted into said orifice, and to conduct feeding solution from the reservoir.

17. The feed dispenser kit of claim 16, wherein the feed reservoir comprises a flexible gasket surrounding the orifice.

18. The feed dispenser kit of claim 15, further comprising a tab disposed on a second end of the feed reservoir for suspending the feed dispenser.

19. The feed dispenser kit of claim 16, wherein the conduit is retained in the orifice by compression pressure exerted on the conduit by the gasket.

20. A feed dispenser kit, comprising:
a feed reservoir containing a feeding solution, wherein the feed reservoir has an orifice at a first end;

a frangible membrane for covering the orifice; and
a conduit adapted to be inserted into the orifice by piercing the frangible membrane and to conduct the feeding solution from the feeding reservoir.

21. The feed dispenser kit of claim 20, wherein the feed reservoir comprises a flexible gasket surrounding the orifice.
22. The feed dispenser kit of claim 20, further comprising a tab disposed on a second end of the feed reservoir for suspending the feed dispenser.
23. The feed dispenser kit of claim 21, wherein the conduit is retained in the orifice by compression pressure exerted on the conduit by the gasket.
24. The bird feeder of claim 20, wherein the container comprises a premixed liquid feeding solution.
25. A bird feeder kit, comprising:
 - a container for holding bird feed, wherein the container comprises a threaded neck having a directional restricting member at a first end; and
 - a threaded screw cap having at least one conduit disposed thereon and a directional restricting member, wherein the threaded screw cap is adapted to screw onto the threaded neck of the container to provide a liquid-tight engagement therebetween, and the directional restricting members respectively disposed on the threaded neck and the screw cap cooperate with one another to allow the threaded screw cap to be unreleasably screwed onto the neck.
26. The bird feeder kit claim 25, further comprising a hanger at a second end.
27. The bird feeder of claim 25, further comprising a gasket disposed between the screw cap and the threaded neck to provide a liquid-tight seal therebetween.
28. The bird feeder of claim 25, wherein said feed is solid feed dissolvable in water.

29. The bird feeder of claim 25, wherein the container comprises a premixed liquid feeding solution.
